

Test Case Report for SauceDemo Web Application

Application: SauceDemo

Test Type: Manual Functional Testing

Tester: Esther Enemchukwu

Date: 26th April 2026

1- Objective

The objective of this testing was to validate the core functionalities of the SauceDemo web application, ensuring that users can successfully complete the end-to-end shopping flow without errors.

2- Scope

The testing covered the following features:

- Login
- Add to Cart & Remove from Cart
- Filtering by all possible option
- View Cart
- Checkout

Out of Scope:

- Performance testing
- Security testing
- API/backend testing

3- Test Environment Details

Item	Details
Browser	Google Chrome v147.0.7727.102
Device	Laptop
OS	Windows
Network	Stable Internet connection

4- Test Techniques

The following test techniques were used:

- **Black-Box and Functional Testing:** Testing was done from an end user perspective without knowledge of the internal code structure. I validated login with valid and invalid credentials, verified error messages for invalid inputs and verified that core features functioned as expected.

- **End-to-End Testing:** The complete user flow across the system was tested to ensure seamless user journey i.e Login → Add/Remove product → Filter → View Cart → Checkout.

- **Automated Testing:** The Playwright automation tool was also used to automate workflows to help speed up testing and enable regression testing.

I chose these techniques because the features tested are user-facing and transaction-based. The most important goal was to confirm that users can complete the main shopping flow without errors.

5- Test Summary

Metric	Count
Total Test Cases	50
Passed	42
Failed	7
Blocked	0
Not Executed	0

6. Defects and Findings

- High Severity

- **Session Timeout Issue:**
Users are frequently redirected to the login page due to immediate session timeout, disrupting the shopping experience.

- Medium Severity

- No success feedback when adding items to cart

- No quantity update option in cart
- No payment and delivery options in the checkout page
- No transaction receipts after successful checkout

- Low Severity

- No “empty cart” message displayed
- The filter dropdown is unresponsive

7- Observations

- Core functionalities (login, cart, checkout) are working correctly.
- Filtering works as expected for the available options.
- Error handling is present but can be improved for better user clarity.
- Session handling needs significant improvement for usability.

8- Possible Improvements

Login

- A Forgot Password option should be added on the login page to enable users change/reset their forgotten passwords
- A password visibility toggle should be added to the password field so users can view their password in an unmasked form and avoid errors
- Users are frequently redirected to the login page due to immediate session timeout, disrupting the shopping experience. The session timeout should be extended, or a timeout warning like ‘**Your session will expire soon. Click Continue to stay logged in**’ should be provided.

Add & Remove from cart

- When an item is added to cart, a success message like 'item added to cart successfully' should be displayed so users can know the action was successful
- Options to increase/decrease quantity of item(s) should be added instead of only Add/Remove which makes users add just one item per time

Filter

- More filter options like category, brand, or availability can be added to help users streamline their preferences
- A search bar can also be added to help users find products quickly

View Cart

- On the cart page, the subtotal of all items should be displayed before checkout. There should also be options for users to increase the quantity of items.
- When the cart is empty and clicked, a message like 'Your cart is empty' should be displayed

Checkout

- Stronger validation should be added for name and postal code fields so users can know what is acceptable
- - After successful checkout, users should receive an order number and a receipt to validate successful payments. A tracking link can also be provided to enable users to track their items.

9. Conclusion

The application is functionally stable for core user flows. However, improvements are required in session handling to improve usability and provide a smoother and more reliable user journey.
